

Standing Verifier Checklist and Plan

Standing Verifier Checklist and Governance Plan

Role established 2026-08-12. Claude acts as adviser, orchestrator and verifier across the whole estate: Drive, Obsidian, GitHub, mail, and the research record itself. This file defines *what I check, how often, and what I report* — so verification is repeatable rather than ad hoc.

Reporting rule (Ali's instruction). I report immediately and unprompted whenever I find: a missing or stale file, a broken link, a document that is wrong or not research-relevant, an unsupported claim, or a sync divergence. I never report an item as verified unless I inspected it directly.

Part 1 — The checklist

A. Every session that touches deliverables

#	Check	Command / method	Pass condition
A1	Drive publish actually landed	<code>scripts/publish-and-verify-drive.ps1</code>	every file OK; never a bare <code>Copy-Item</code> into <code>G:\</code>
A2	Re-verify after settle (Drive can revert)	re-compare sizes 20–60 s later	all HOLDING
A3	Canonical folder ≠ stale	size/hash compare topic folders vs <code>outputs/</code>	identical
A4	Claim-boundary scan	regex for accuracy/generalization/clinical/effort claims	zero hits
A5	Evidence guard	<code>python scripts/check_evidence_consistency.py</code>	18/18 PASS
A6	No fabricated citation	every source traceable to a named origin file	100 % traceable
A7	Repo protected paths	<code>scripts/check_hlayer_protected_paths.py</code> + <code>git status -- VEGO-AI</code>	PASS / empty

B. Weekly (before each supervisor meeting)

#	Check	Pass condition
B1	Every meeting requirement mapped to a deliverable with evidence	no unmapped requirement
B2	Package folder complete, numbered, and byte-verified	matches the index
B3	Tracking document reflects reality on the day	no "done" that is not done

B4	Evidence gates restated with current counts	EXP-005, medical gates, searches
B5	Open decisions listed with owner	each has an owner and a blocking note
B6	Uncommitted work committed and pushed	<code>git status</code> clean, 0 unpushed
B7	Wording provisional-ness stated wherever RQs appear	no artifact implies approval

C. Monthly (estate health)

#	Check	Pass condition
C1	Full Drive tree inventory + stale-file sweep	no file older than its repo source
C2	Obsidian links resolve; no dangling junctions	all resolve
C3	Branch divergence review	no branch >50 commits behind without a plan
C4	Stale PR review	none open >14 days without a decision
C5	Unrelated/incorrect documents in research folders	none
C6	Data-boundary audit (no patient data, no secrets)	clean
C7	Backup reality check: does anything exist only on one disk?	nothing

D. Continuous red flags — I report these the moment I see them

- A claim of accuracy, generalization, clinical performance or effort reduction anywhere.
- A citation I cannot trace to a verified origin.
- A "completed literature review" implication while `QL-01...QL-05` are unrun.
- A supervisor wording presented as approved before `D-RQ-01/D-RQ-02` are logged.
- A file on Drive older than the repo source it came from.
- Patient data, credentials, tokens or secrets anywhere in the repo or the general Drive.
- A document in a research folder that is not research (or is factually wrong).

Part 2 — Open items and the plan to close them

Ordered by urgency. **Owner "Ali"** means it cannot be done by anyone else.

Immediate — before/at today's meeting (2026-08-12)

#	Item	Owner	Action
---	------	-------	--------

P1	Verify the RQ wording (A08-01)	Ali	Open the saved working draft from the Aug-5 call. Settle: <i>exploration</i> vs <i>identification/classification</i> ; <i>human</i> vs <i>expert</i> judgment. This blocks Chapter 3 sign-off
P2	Confirm the Drive is shared with Iris and Arnon (A08-05)	Ali	Check the share dialog on VEGO-AI PhD Working 2026 ; grant comment/edit. I cannot see ACLs
P3	Open the package from Drive once before presenting	Ali	Confirms the correct (52,922 B) Chapter 3 renders — belt and braces after the revert incident
P4	Capture decisions during the meeting	Ali	Use the post-meeting capture table in the walkthrough doc; 8 decisions are queued

This week

#	Item	Owner	Action
P5	Commit and push the 13 uncommitted files (G-01)	Claude + Ali	The whole Aug-12 package exists only on local disk. Commit to a branch and PR
P6	Resolve the two literature spreadsheets (D-04)	Claude	Retire or clearly mark the 07-30 .gsheet as superseded so Iris has one authoritative file
P7	Decide on PR #14 (G-02)	Ali	Merge or close — 2.5 weeks stale
P8	Apply the supervisors' wording ruling	Claude	One find-replace pass across every artifact, then re-verify and re-publish

Decisions I need from you (not urgent, but they shape everything)

#	Question	Why it matters
Q1	Should the Obsidian vault stay in the Parallel Wireless OneDrive? (O-01)	Your PhD is personal work; the vault currently lives in your employer's tenant. Moving it to a personal location (or straight onto G:\) removes an IP/ownership question before the proposal is submitted
Q2	Do you want an academic/personal mailbox connected? (M-01)	Right now the only mail I can see is your work Outlook. I cannot verify anything about Iris's or Arnon's correspondence — including her check-in email — and I will keep marking those NEEDS ALI until this

		changes
Q3	Do the divergent agent/* branches still matter? (G-03)	172 and 184 commits ahead. Either they get merged soon or they should be archived — the merge cost grows every week
Q4	Should _Ali private .md files become .docx ? (D-05)	Google Drive cannot preview .md . Fine if they are for you only

Longer arc — to proposal submission

Phase	Window	Gate
Wording locked	after 2026-08-12	D-RQ-01/D-RQ-02 logged
Literature searches executed	after wording lock	QL-01...QL-05 run, screened, appraised
§2 written	after searches	structure chosen (D-CH2-01)
§4 written	after artifact decision	D-ART-01 settled
Expert labels collected	ongoing, blocking	≥20 generalization-safe (currently 0 of 24)
Plan A vs Plan B decision	2026-08-26 internal checkpoint	medical gates all six, or fall back to Plan B
Proposal submission	Sept–Oct target	supervisor approval + university process verified

Part 3 — How I will report to you

Every time I do work I will give you:

1. **What I verified** — with the actual evidence (byte counts, exit codes, hashes), never "looks fine".
2. **What I found wrong** — flagged by severity, with the fix applied or the reason it needs you.
3. **What I could not verify** — stated explicitly rather than assumed (mail, Drive ACLs, cloud state).
4. **What needs you** — a short list, each item saying exactly why nobody else can do it.

I will not mark anything done that is not done, and I will not present a draft as approved.
