

Live Walkthrough and Anticipated Q&A

Aug-12 Live Walkthrough — Running Order and Anticipated Q&A

Prepared for the supervisor meeting, Wednesday 2026-08-12, 09:00 (Iris, Arnon, Ali). Deliverable **A08-08** ("present progress live"). **Rehearse once before the meeting.**

Part 1 — Running order (target: 25 minutes presenting, rest discussion)

#	Item	Minutes	What to show	The one sentence to say
1	Where we are	2	Tracking workbook → <i>Deliverables</i> sheet	"Five of the seven things you asked for are in the folder; two need me — the Drive share and your email."
2	Your corrections, applied	4	Tracking workbook → <i>Aug-5 Requirements</i> sheet	"Every correction from the 5th is implemented and traceable — and I've flagged two places where I could not tell what was agreed."
3	Chapter 3 — the gap	6	Chapter 3 §3.2 positioning table, then §3.3	"Four bodies of work each solve part of this; nobody connects them — and that connection is where the open questions are."
4	Chapter 3 — the questions	6	§3.4–§3.7, one at a time	"Each question has its evaluation criterion built in, so each one can fail — and a failure would still be a result."
5	Literature spreadsheet	4	Workbook → <i>Sources</i> , then <i>Coverage Gaps</i>	"Forty verified sources tagged by question — and here is what the corpus does not cover, which is the more useful half."
6	§2 and §4 thinking	3	Thinking notes, Part 3	"I thought about both and started neither,

			questions	as you asked. Here are the decisions I need from you before either can start."
7	Decisions needed	5	Tracking workbook → <i>Decisions Open</i>	"Eight decisions. The first three block everything downstream."

If time runs short: items 3, 4 and 7 are the meeting. Items 1, 2, 5, 6 can be read from the folder afterwards.

Part 2 — The three things to say plainly

1. **Chapter 3 is done and it is cited.** The previous draft asserted gaps without references; this one grounds every positioning claim in the seed corpus and marks each openness statement as a candidate claim for the unrun searches to confirm or refute.
2. **Two wording discrepancies surfaced, not buried.** The record says **E6** narrowed the question to *identification/classification*; the reconstructed wording says *exploration*. And the main question says *human* judgment while SQ2/SQ3 say *expert* judgment. Both need the saved draft.
3. **The evidence position has not moved, and the chapter says so.** 0 of 24 labels, 0 of 6 medical gates, searches not run. Chapter 3 states this in a table rather than leaving it to be discovered.

Part 3 — Anticipated questions and honest answers

On the gap and the questions

"Is this actually novel?" Not established, and the chapter does not claim it is. The searches are frozen and unrun, so every "no established approach does X" is labelled a candidate claim for Chapter 2 to confirm or refute. What *is* defensible today: four bodies of work each address a part, and the seed corpus contains nothing that connects selective intervention, governed capture, and scope-aware reuse.

"Silva et al. already did human-in-the-loop LLM domain modelling — how are you different?" That is the nearest neighbour in the seed corpus, and full text has not been read yet, so the honest answer is: the distinctness claim is pending. At title level it positions the human *inside the modelling activity*; this proposal asks when a system should *decide to interrupt*, what is retained afterwards, and whether it may be reused elsewhere. Reading it properly is a Chapter 2 task.

"Why three sub-questions? Are they sufficient?" They cover capture, governance, and use. Whether they are *jointly sufficient* for "reliable human–AI co-reasoning" is stated in §3.8 as an open

decomposition question — none of the three takes reliability itself as its object. That is a genuine question for this meeting, not a hole I missed.

"Isn't this just describing VEGO-AI?" No, and §3.9 is written to prevent that reading: VEGO-AI is the motivating case and the vehicle, the question is the contribution, and Chapter 4 treats it as one of two instantiation contexts. If any part of the chapter reads as a product pitch, that is a defect I want pointed out.

"You use 'variability' — but that word already means something in SPL research." Correct, and §3.2.4 addresses it explicitly: that tradition studies *designed* variability; this thesis studies *observed interpretive* variability. Same word, different phenomenon, and the formalism does not transfer. The construct is defined properly in Chapter 2.

On evidence

"What can you actually claim today?" Mechanism, architecture, traceability and readiness in the software/modelling domain. Not accuracy, not generalization, not effort reduction, not anything clinical. §3.11 states this as a table.

"When do the labels arrive?" That is the binding constraint and it is not solvable by more building. It needs two independent reviewers and an adjudicator; the resourcing question is open (see the decisions sheet). Until then Study 3's quantitative arm cannot start.

"What if the results are negative?" Each question is falsifiable and a negative result is reportable — §3.11 says what failure means for each. That is deliberate: a bounded negative finding about when human judgment can be reused is a contribution, not a failed project.

On process

"Why haven't you started the literature survey?" Because you asked me not to. The instruction was to think about §2 and §4 and not begin them. The thinking is in the options note; the searches are frozen and ready to run the moment you confirm the direction and the wording.

"Why is the wording still provisional?" Because the final text was assembled live and the record is a machine transcript with inferred speakers — it is not a reliable source for exact wording. I need to check my saved draft (A08-01), and I have flagged the two specific places where the record and the reconstruction disagree rather than silently choosing.

"Is the title still right?" No — and that is raised as D-TITLE-01. It still contains "Reusable", "Auditable" and "Transferable", the words the headline dropped on the 5th. Three replacement candidates are in the proposal document.

On the medical extension

"Where does the medical work stand?" Infrastructure and feasibility only; 0 of 6 entry gates pass. It is deliberately outside the question's wording — SQ3 says "when governance and access permit" — so the doctorate remains fully answerable in software/modelling alone. The 2026-08-26 internal checkpoint decides Plan A vs Plan B.

Part 4 — Post-meeting capture (fill in during or immediately after)

For each E-item and each open decision, record one of: **Accepted**, **Accepted with changes**, **Rejected**, **Deferred** — plus the actual final wording where it applies.

To capture	Where it goes
Final U-RQ and SQ1–SQ3 wording	Decision log as D-RQ-01/D-RQ-02; then one find-replace pass across all drafts
Title decision	D-TITLE-01
Chapter 2 structure choice	D-CH2-01
Artifact granularity ruling	D-ART-01
Search execution timing	D-SEARCH-01
Which preliminary results may appear	D-PRELIM-01
Any attribution corrections to the 2026-08-05 record	The meeting record's confirmation protocol
Reviewer/adjudicator resourcing	Action register

Rule: nothing is marked approved because it is consistent with a draft. It is approved only when a supervisor says so and it is logged.
